

Amazon B2B Lead Generation Case Study

Meta Ads campaign | Campaign period: May 2026

Client: Amazon services business (name withheld)

This campaign was created for a B2B company offering Amazon-related services. The goal was simple: generate relevant enquiries from business owners while keeping the campaign controlled, easy to review, and focused on lead quality rather than vanity numbers.

TOTAL BUDGET	TOTAL LEADS	AVERAGE COST PER LEAD
\$487.62	19	\$25.66

Campaign brief

The client wanted to test whether Meta Ads could generate interest from people already involved in selling on Amazon. Because this was a B2B service, the campaign was not built around getting the cheapest possible clicks. The priority was to attract people with a genuine business need and move them through a clear enquiry process.

How the campaign was approached

I kept the structure intentionally simple. Instead of spreading the budget across too many audiences and ad variations, the campaign started with a small number of clear messages. Performance was reviewed regularly, weaker variations were reduced, and more of the budget was directed toward the combinations showing the strongest response.

Core campaign setup

- Audience direction focused on Amazon sellers, business owners, and people already interested in Amazon growth services.
- Ad messaging highlighted practical business problems rather than listing every service in one advertisement.
- The conversion path was kept straightforward so prospects could understand the offer and submit an enquiry without unnecessary steps.
- Budget allocation was reviewed during the month to avoid continuing spend on weaker ad variations.

Results and Campaign Review

A practical review of what the May 2026 campaign achieved

Result summary

During May 2026, the campaign generated 19 leads from a total ad spend of \$487.62. This produced an average cost per lead of \$25.66. For a focused B2B offer, the result provided a useful starting point for understanding which message and audience direction attracted the most interest.

19 leads generated | \$487.62 spent | \$25.66 average CPL

What helped the campaign

- Direct messaging built around the problems potential clients were already trying to solve.
- A controlled test structure that made it easier to identify stronger and weaker variations.
- A simple lead journey without adding unnecessary steps or distractions.
- Regular performance checks instead of leaving the full monthly budget to run unchanged.

An honest takeaway

A lead does not always become a client immediately, especially in B2B services. Follow-up speed, qualification, pricing, and the sales conversation all affect the final outcome. For that reason, this case study focuses only on the advertising results that can be shown clearly: the total spend, the number of leads generated, and the average cost per lead.

Recommended next steps

- Retarget people who visited or engaged but did not submit an enquiry.
- Test stronger proof-based creative while keeping client information private.
- Improve qualification questions to reduce low-intent enquiries.
- Increase budget gradually only after confirming lead quality through follow-up.

Confidentiality note

The client name, contact details, business identifiers, account access information, and other confidential data have been removed. Only the main campaign figures and a high-level summary of the work are included in this document.
